WHAT IS **BLENDR?**

Blendr is a social networking experience unlike any other. Using your mobile device's location-based technology, you can connect with others nearby with similar interests, hobbies, profession and much more. Discover the world around you: make friends, and build connections and explore your surroundings. Blendr makes it easy to take that first step.

Grindr. It's a guy thing.

Grindr is the largest all male location-based mobile network tool for Android, iPhone, iPod touch, iPad and BlackBerry.

Bridging the Gap Between Physical Location and Online Social Networks

The purpose of this work is to explore the relationships between online social networks, and the real world mobility patterns of their users.

We wanted to understand how the network of interactions on Facebook differs from the network of real world interactions.

- ▶ We studied location data from over 200 Pittsburgh residents.
- ▶ Some were continuously tracked via smart phones
- ▶ Others' locations were approximated more discretely via their laptop usage.
- ▶ We compared their collected location histories with data collected from their Facebook accounts.

One of the questions we address in this work

Co-Locations

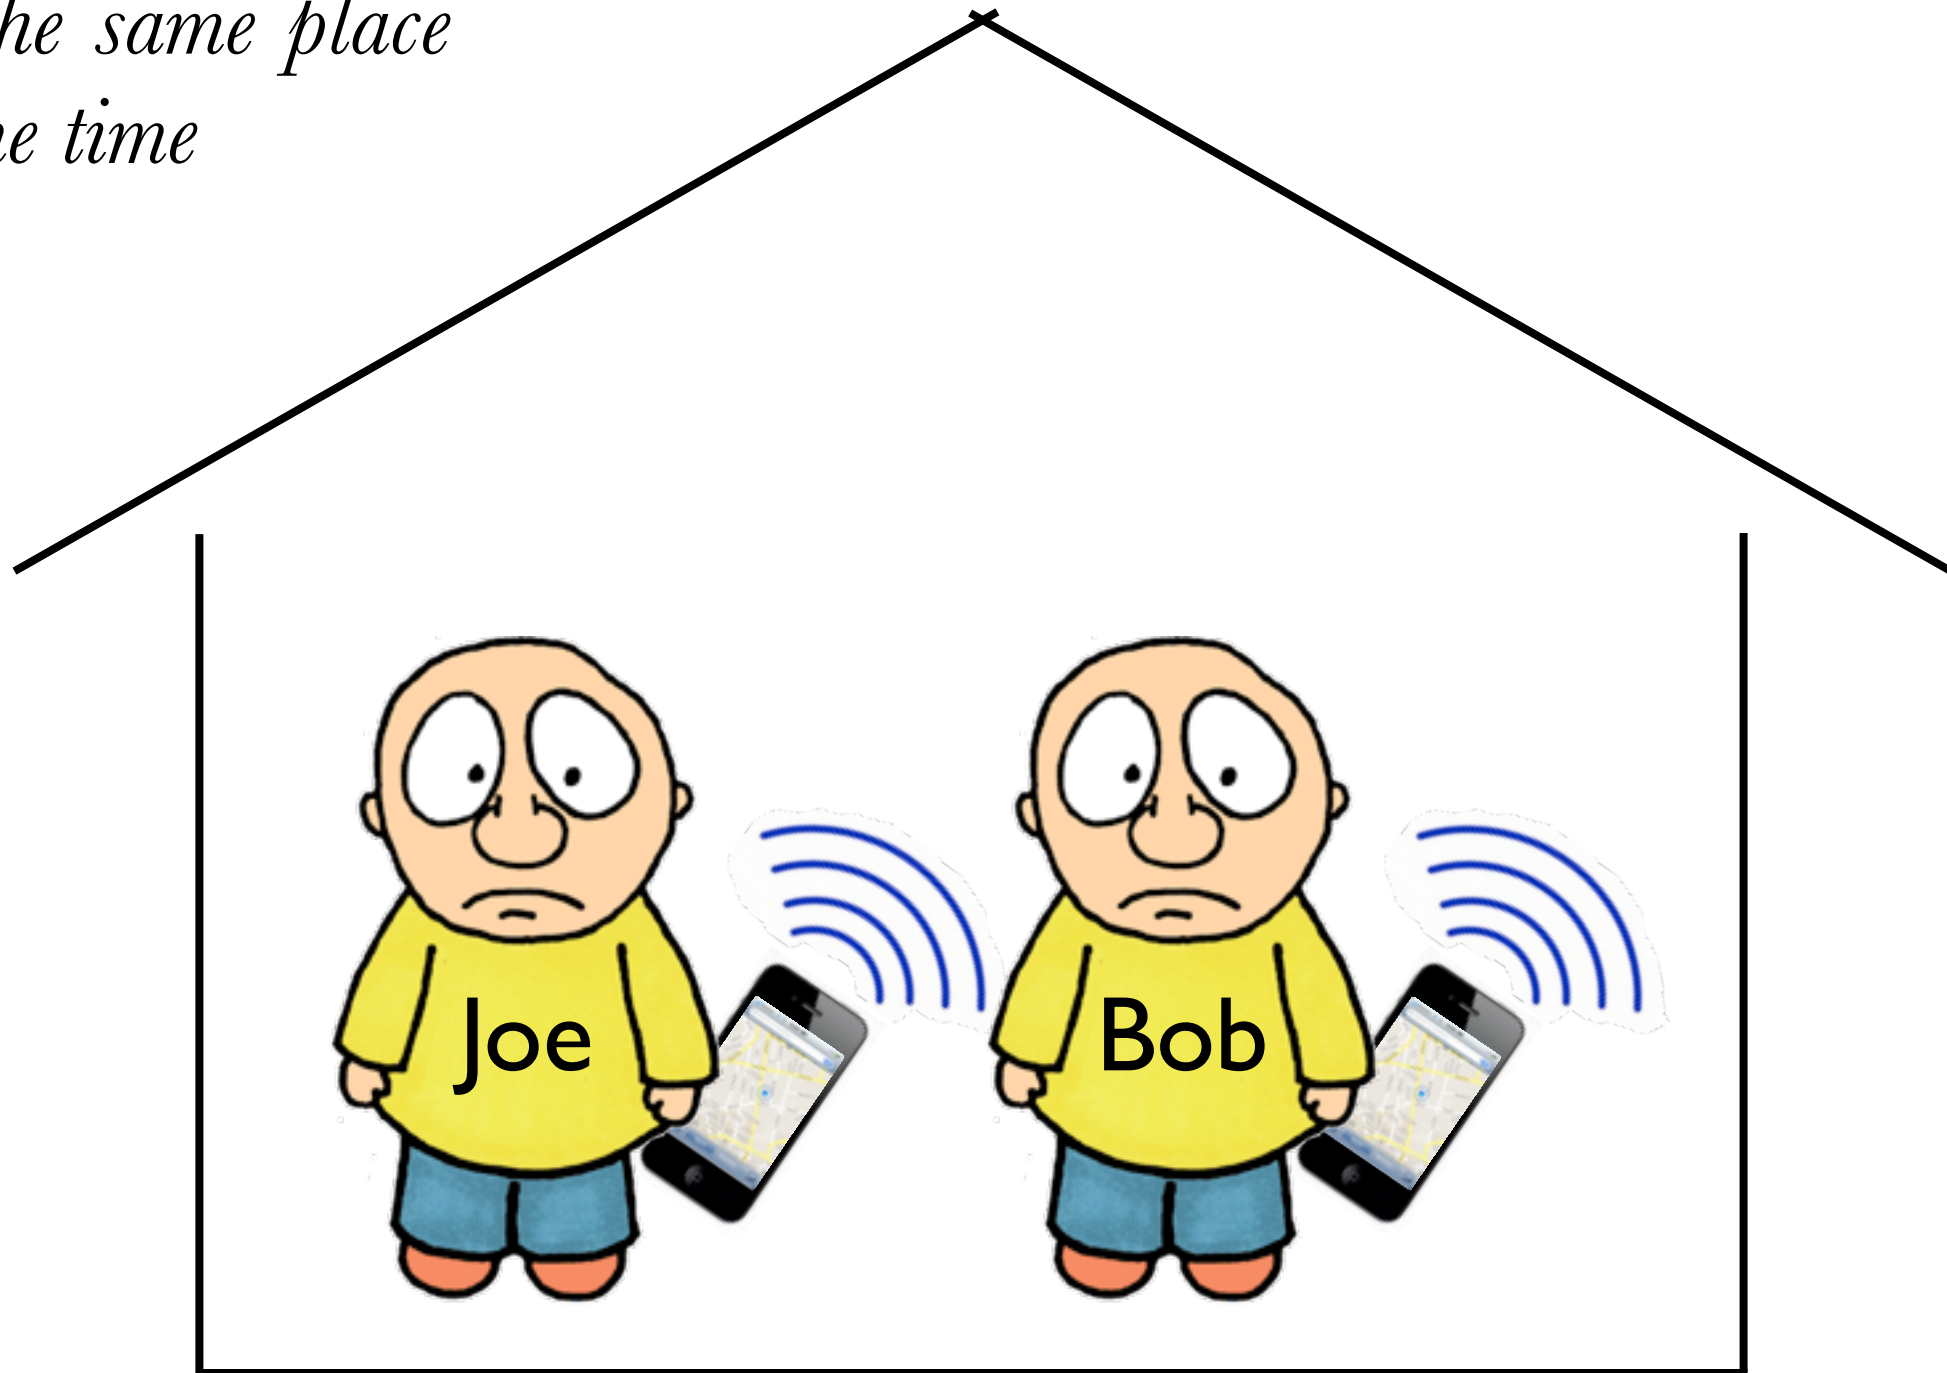

*being in the same place
at the same time*

We approach the problem in a very natural way. We look at the history of co-locations between Joe and Bob.

Co-Locations

*being in the same place
at the same time*

However, even with the history of co-locations between users, it's still highly non-trivial to predict affinity.

Co-Locations

*being in the same place
at the same time*

One reason for the difficulty (there are many) is the large number of *familiar strangers* found in a dense urban environment.

Co-Locations

*being in the same place
at the same time*

*Familiar Strangers: two people
that often encounter one another,
but don't know each other.*

One reason for the difficulty (there are many) is the large number of *familiar strangers* found in a dense urban environment.

Co-Locations

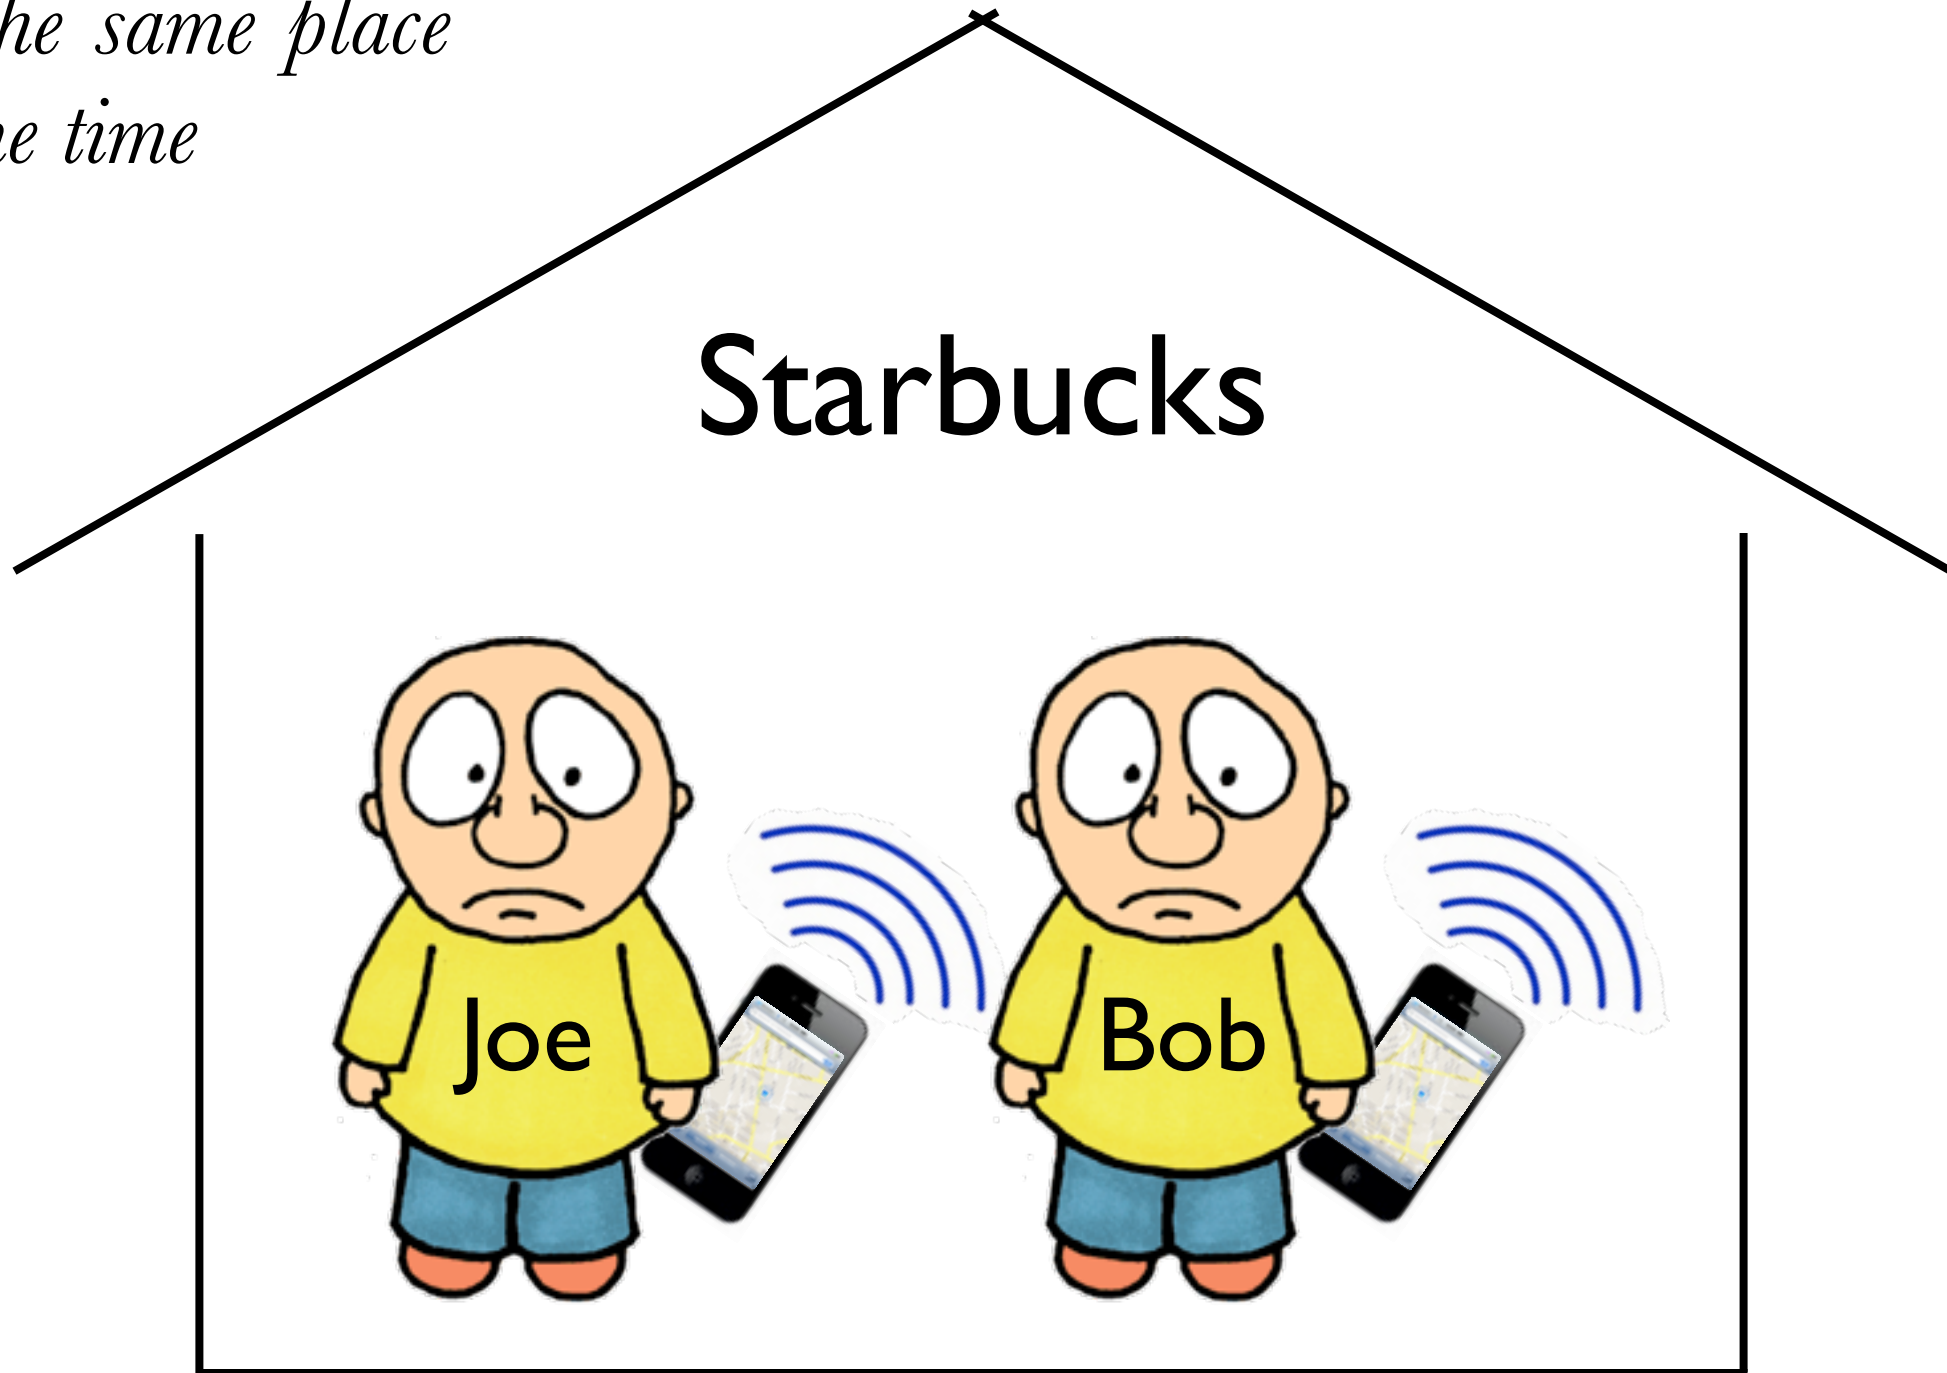

*being in the same place
at the same time*

Context matters when looking at co-locations.

Co-Locations

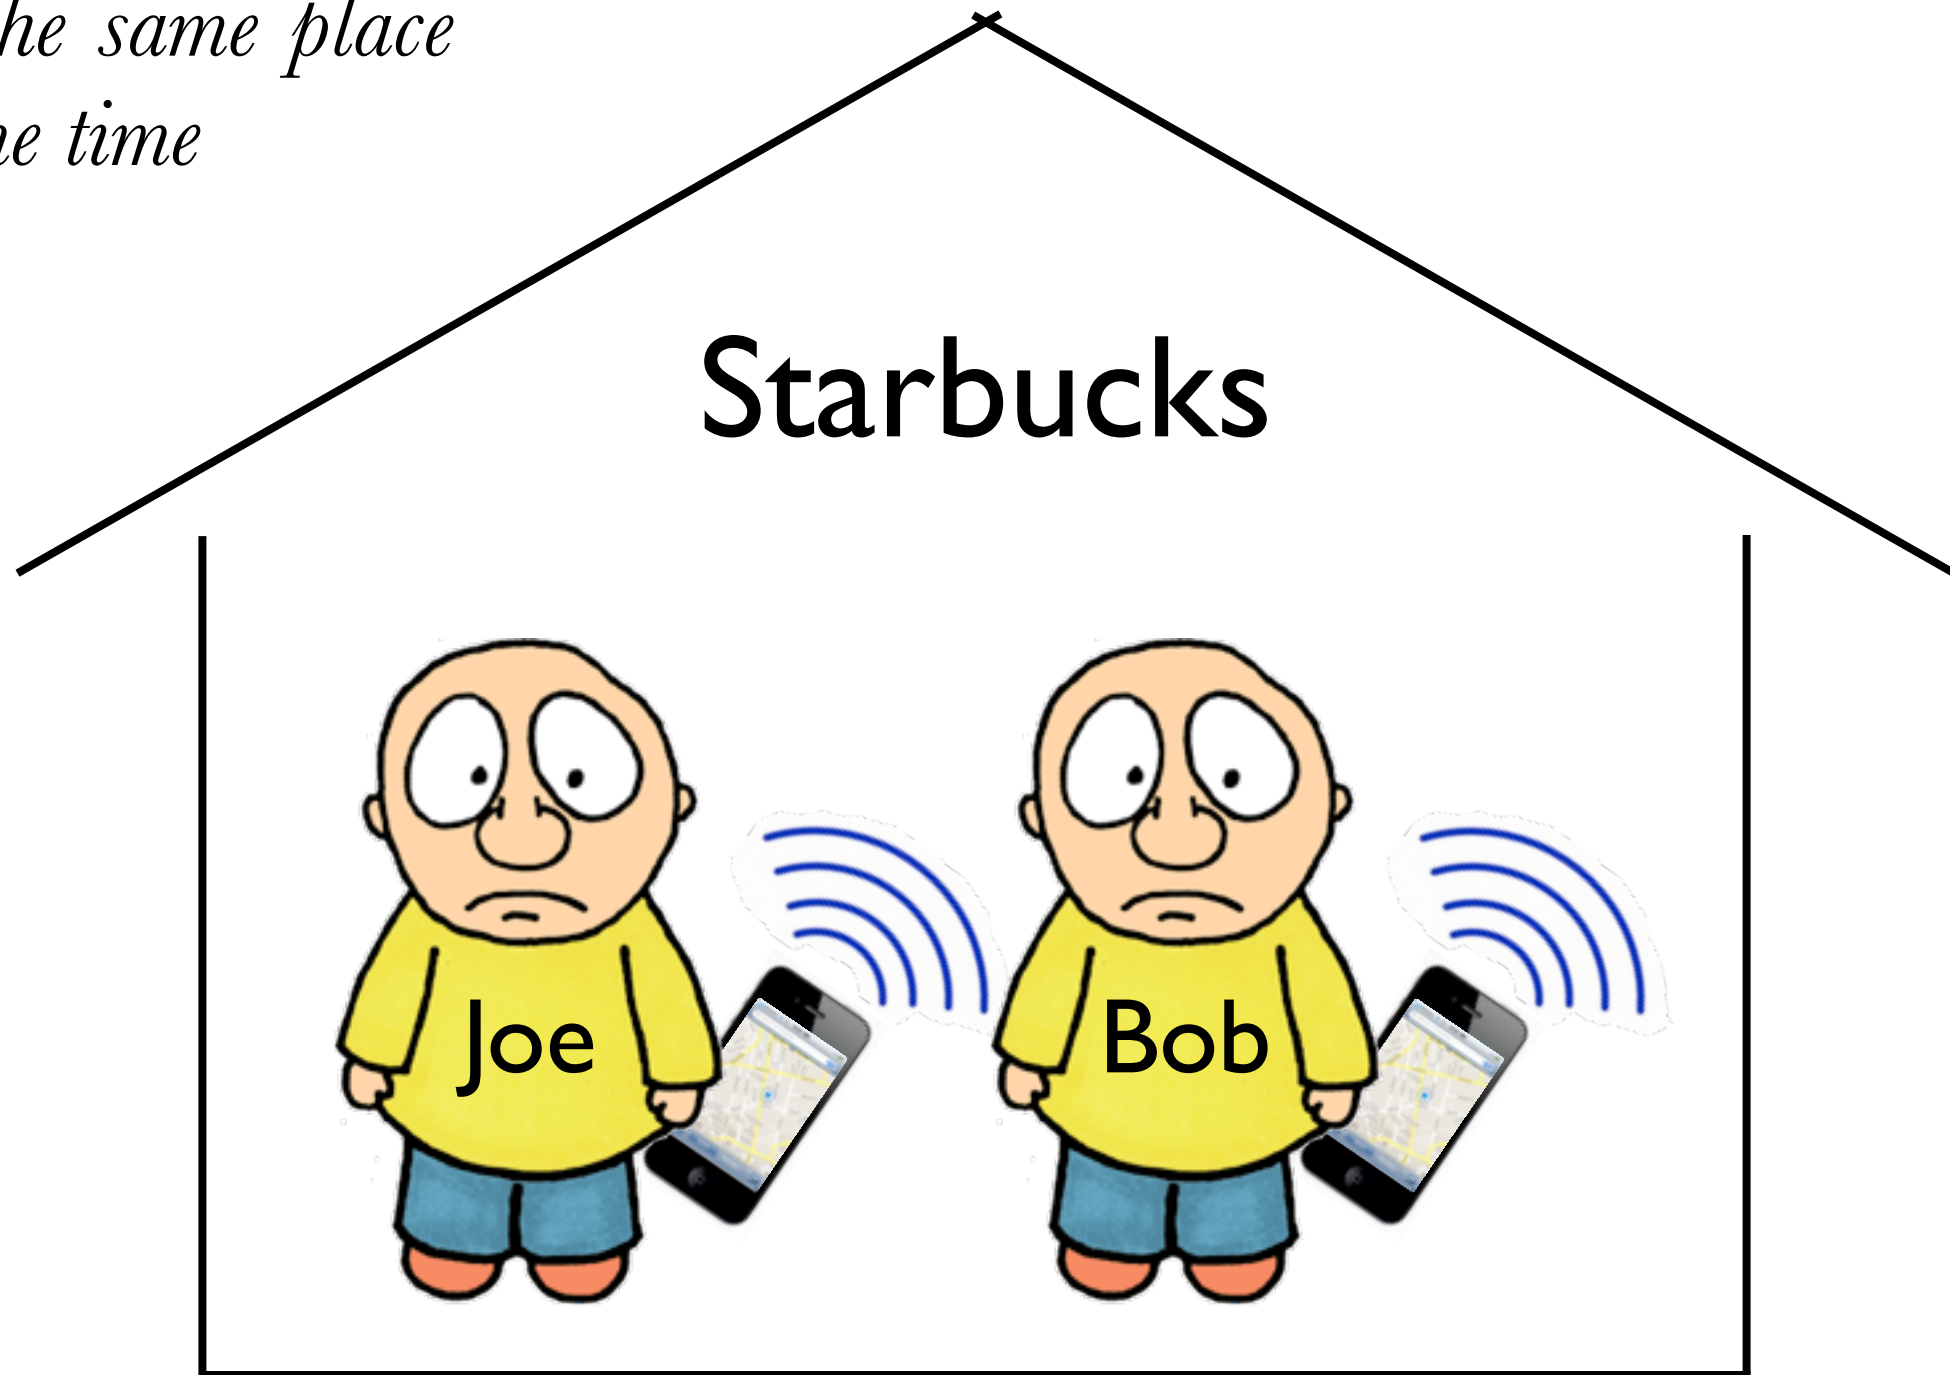

*being in the same place
at the same time*

Context matters when looking at co-locations.

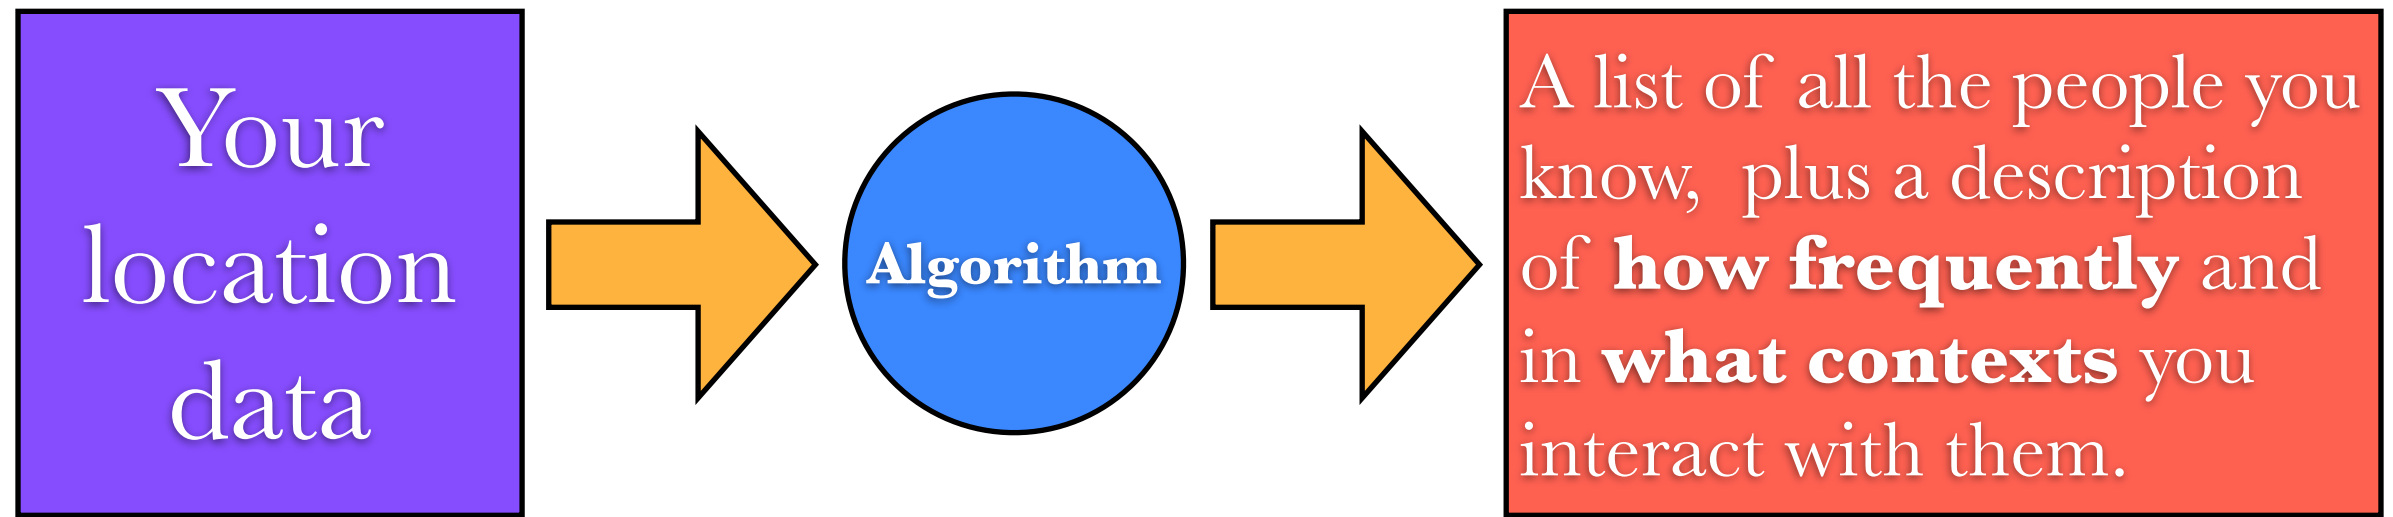

Co-Locations

*being in the same place
at the same time*

We designed a set of contextual properties of co-locations that predict pretty well whether or not two people are friends.

What are the privacy
implications here?

What are the privacy implications here?

You were observed to be at Location A **between Sunday September 21, 8:48pm and Monday September 22, 9:02am.**

Please indicate whether or not you would have been comfortable sharing your location during this time with each of the groups below.

[Click here if you believe that this observation is completely inaccurate.](#)

Your Close Friends and Family?
(e.g., Jim, Mary, Pam, etc.)

Yes, during this entire time
 No, not during any of this time
 Yes, during part of this time...
 Yes, for some of these people

I would have been comfortable sharing my location from:

9/21 8:48 pm

to:

9/22 9:02 am

[Add an additional time span.](#)

Would you have been comfortable sharing your location **between Sunday September 21, 8:48pm and Monday September 22, 9:02am** with:

Figure 4: The average accuracy (bars indicate 95% confidence intervals) for each group, under each of the different privacy-setting types. For these results, we hold constant the cost for inappropriately revealing a location at $c = 20$.

- ▶ White-lists (on and off switches) do pretty well at capturing sharing preferences with close friends and family.
- ▶ For sharing with more diverse social groups, more expressive policies are required to capture user preferences.
- ▶ Even the most complex policies are only 60-70% efficient for social groups beyond Friends and Family.

Figure 4: The average accuracy (bars indicate 95% confidence intervals) for each group, under each of the different privacy-setting types. For these results, we hold constant the cost for inappropriately revealing a location at $c = 20$.

Location Sharing Policies

Comments, Limitations,
Criticisms???

Comments, Limitations, Criticisms???

[raise hands now]

- ▶ Efficiency is a **best case** analysis. It assumes the user is actually capable of knowing (and specifying in advance) the optimum policy. Real world policies will be less accurate.

Comments, Limitations,
Criticisms???

- ▶ Efficiency is a **best case** analysis. It assumes the user is actually capable of knowing (and specifying in advance) the optimum policy. Real world policies will be less accurate.

Comments, Limitations, Criticisms???

- ▶ The analysis (for the most part) ignores **user motivations** and **utilities** of sharing. There are many complex reasons why people would want to share their location. It's difficult for the participant to anticipate in advance what these reasons might be.

Why do people share
their location?

Why do people share
their location?

[sorry, raise hands again]

Location Sharing is more
than checking up on friends.

Checkins

- ▶ When users are at a place they want to share with their friends, they “check-in.”
- ▶ Check-ins are viewable only by your social connections, and other people who are checked-in to the same place as you.
- ▶ If people are checked in near by to you, you’ll receive a push notification on your phone.
- ▶ Users get points and rewards for checkins.

- ▶ Your friends' check-ins provide ambient cues into what they're up to.

- ▶ Your friends' check-ins provide ambient cues into what they're up to.

- ▶ Your friends' check-ins provide ambient cues into what they're up to.

- ▶ By seeing where your friends go, you can discover new places to visit.

- ▶ Your friends' check-ins provide ambient cues into what they're up to.

Takeaway:

- ▶ People share their locations for lots of different reasons.
- ▶ Understanding user motivations is important to understanding how to design privacy mechanisms for location sharing.

- ▶ UbiComp envisions a world with thousands of invisible computing devices embedded wherever we go.
- ▶ This suggests we can expect lots of third party devices tracking our location (not just cell phones).
- ▶ This may mean even **less** control over our location data (at least the smart phone is **ours**).
