

# Security of Safety-Critical Devices

Frankie Catota and Adam Durity

April 8, 2014

# Outline

- ❑ Introduction
- ❑ Medical devices
  - ❑ Risks
  - ❑ Defense Approaches
  - ❑ Perception
- ❑ Vehicle safety
- ❑ Other safety-critical areas
- ❑ Economics of safety-critical devices

# Safety-Critical Devices

- ❑ “Safety-critical systems are those systems whose failure could result in loss of life, significant property damage, or damage to the environment.”  
– John C. Knight
- ❑ Security in Safety-Critical Systems: maintaining safety in the presence of an active attacker
- ❑ Medical Systems
  - ❑ Implantable Medical Devices (IMD)

# Implantable Medical Devices (IMD)

- ❑ Embedded computers
- ❑ 350K Pacemakers & 173K Cardiac Defibrillators in 2006

healthcareitsystems.com

# Operational Requirements

- ❑ Collect information (diagnostics)
- ❑ Disable IMD before conducting surgeries
- ❑ Reprogramming
- ❑ Access in emergency situations (authentication)—  
rapid and reliable access —challenge
- ❑ Constraints
  - ❑ Limited capacity of battery (replacement -necessitates surgery). Implications: injuries and death
  - ❑ Microcontrollers

# Risks in Medical Devices

## ❑ Vulnerabilities

- ❑ Authentication

## ❑ Attack Vectors

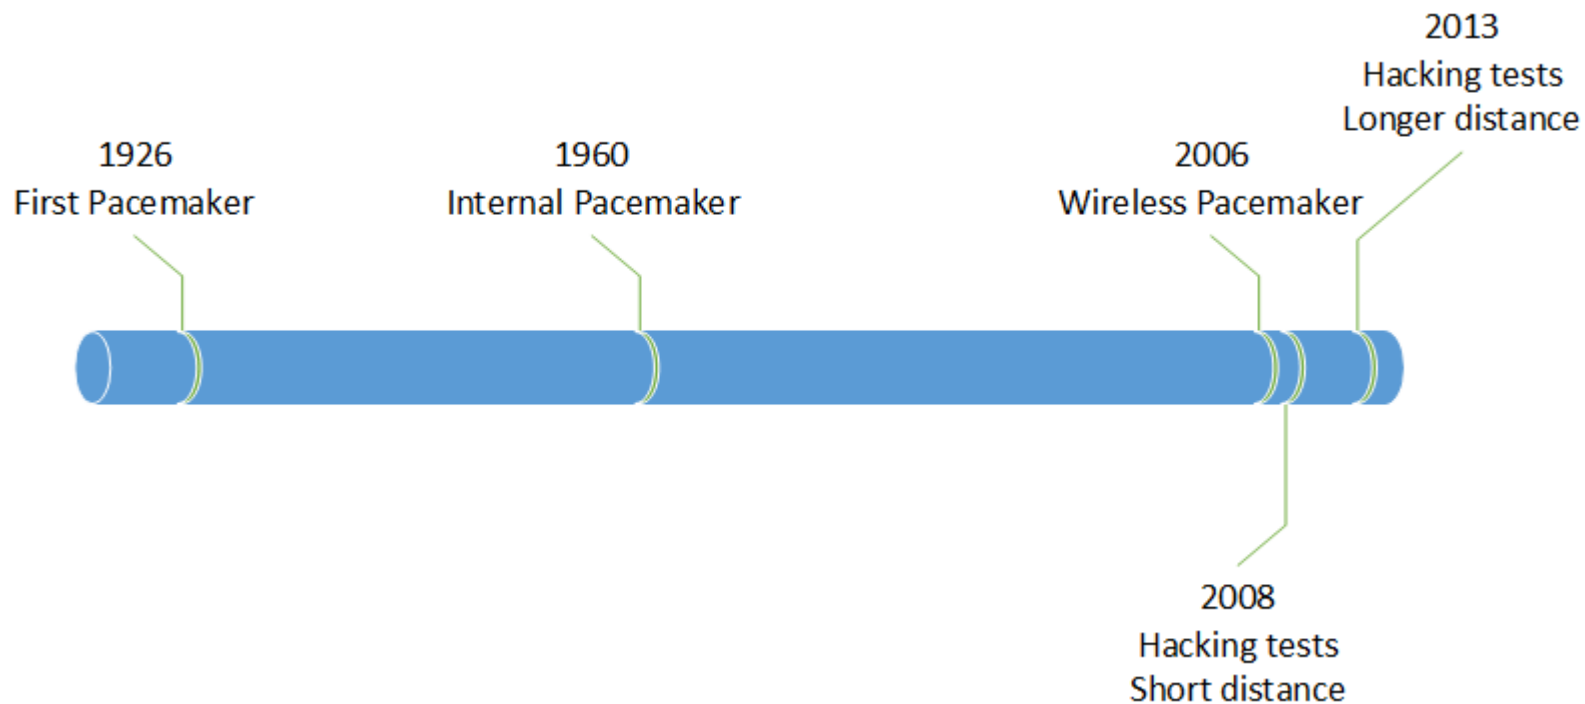

- ❑ Passive
- ❑ Active

## ❑ Risks / threats

- ❑ DoS
- ❑ Changes in configuration
- ❑ Replace medical records – someone having a different operation
- ❑ Injuries, death

# Pacemakers

Networking changes the treat model

# Hacking Tests (1)

- ❑ **2008:** wireless access to a combination heart defibrillator and pacemaker (within two inches of the test gear) –Kevin Fu
- ❑ Disclose personal patient data
- ❑ Reprogram IMD to shut down and to deliver jolts of electricity that would potentially be fatal
- ❑ Authors: “The risks to patients now are very low”

# Hacking Tests (2)

2011-2012-2013

## ❑ Hacking Insulin Pumps

-- insulinpump.com

2013 – Black Hat /Defcon:

- ❑ **“Implantable medical devices: hacking humans”**
  - ❑ At 30 feet by compromising their pacemaker
  - ❑ Transmitter to scan for and interrogate individual medical implants
  - ❑ Security techniques for manufacturers

-- ioactive.com

# Defense Approaches

- ❑ How do we achieve resistance to attacks?
- ❑ Fault-tree analysis --What can go wrong?
- ❑ How strong a security policy should be?
  - ❑ Security
  - ❑ Safety

# Access Control: Authentication Methods

- ❑ Passwords: how to make them available?
  - ❑ Tattooed passwords (visible, UV visible)
  - ❑ Bracelet
- ❑ Biometrics (face recognition)
- ❑ Smart Cards
- ❑ Touch-to-access policy
- ❑ Key-based systems
- ❑ Shields
  - ❑ Necklace
  - ❑ Computational wristband

-- Figures from Denning et al.

# Authentication: Touch to Access Policy (1)

- ❑ Physiological value  
EGG as an authenticator
- ❑ IMD authentication based on Inter-pulse Interval (IPI)
- ❑ Extract uncorrelated random bits

Electrocardiography (ECG)  
Wave form

- Rostami et al.

# Authentication: Touch to Access Policy (2)

Independent synchronous readings --two steps:

- ❑ Establishing a secure channel (TLS)
  - ❑ Programmer - server
  - ❑ IMD - client (avoid burden of PKI)
- ❑ Mutual authentication
  - ❑ IMD reveals  $\alpha$  (randomness of  $\alpha$ )
  - ❑ Programmer reveals  $\beta$
- ❑ Privacy
  - ❑ Medical data is not revealed -only  $\alpha$
- ❑ Detect attacks from deviations from (alpha)
- ❑ Promiscuous mode (IPI flat - Heart attacks)

H2H operation

- Rostami et al.

# IMD Shield

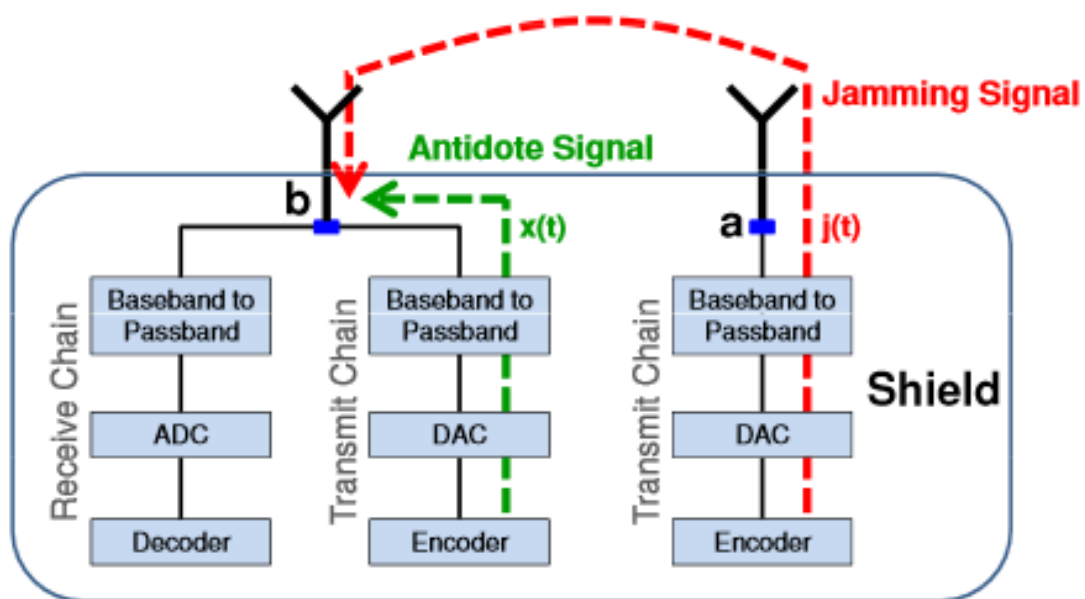

- ❑ Proxy (messages exchanges)
- ❑ Authentication + encryption (channel)

- IMDShield -mit.edu

# IMD Shield - Implementation

- ❑ Jammer design (full duplex radio)

- S. Gollakota et al. MIT

# Wristbands / Alert Bracelets

- ❑ Safety in emergencies
- ❑ Security & Privacy under adversarial conditions
- ❑ Battery life

# Wristbands / Alert Bracelets

- ❑ Protection is granted while wearing the bracelet.
- ❑ Remove to gain access to the IMD
- ❑ Inform patients about malicious actions – But not preventive
- ❑ Authentication + symmetric encryption
- ❑ Disadvantages
  - ❑ Relies on the patient wearing the bracelet
  - ❑ Reactive
  - ❑ No desired scenarios (bracelet close but not found)
  - ❑ Cognitive effects on patients

--Denning et al.

# Perceptions of Authentication Methods (1)

## Concerns about safety and privacy

- ❑ Hospitals not having correct equipment to scan tattoos and UV-visible tattoos (emergencies)
- ❑ Visual indicator of patients condition (something is wrong). Personal dignity.
- ❑ Carrying one more device
- ❑ Aesthetics
  - ❑ Wristbands (especially). “Mockups are unaesthetic”
  - ❑ Tattoos
- ❑ Mental and physical inconvenience
- ❑ Cultural and historical associations (concentration camps, drunks)
  - ❑ Tattoos –negative associations
- ❑ Self-Image –consistence with desired image

# Perceptions of Authentication Methods (2)

- ❑ Notification availability –strong negative reactions
- ❑ Medical information
- ❑ No concerned about someone getting access to their IMD change configurations
- ❑ Some do not have the perception of a real risk --“be my guess”

# Evaluation Results

Password and Body Modification (n=11)			
Mockup System	Liked	Disliked	Would Choose
Medical Alert Bracelet	0%	27%	0%
Visible Tattoo	9%	55%	9%
UV-Visible Tattoo	18%	27%	18%

Data from T. Denning et al.

# Group Activity

- ❑ Get into groups and discuss other possible attack vectors against any medical system. A frame to discuss about it may be:
  - ❑ Vulnerability
  - ❑ Attack (actor + motivation)
  - ❑ Consequences

# Automobiles

- ❑ Modern automobile
  - ❑ Numerous interconnected microcontrollers
  - ❑ Some luxury models have more than 70 controllers
  - ❑ Many safety systems (e.g. airbag, brakes, seatbelt pretensioners, traction and stability control)
- ❑ Controller Area Networks (CAN) enable various controllers to communicate
  - ❑ All interface with the required OBD-II diagnostics port
- ❑ Since 2007, all automobiles have tire pressure monitoring systems (TPMS)

# Automobiles: Attack Vectors

These numerous controllers and other systems are all potential security attack vectors

- ❑ Checkoway et al. examined external vectors
  - ❑ Indirect physical access
  - ❑ Short-range wireless
  - ❑ Long-range wireless
  
- ❑ Do vulnerabilities exist within these vectors?
- ❑ What can an attacker do upon gaining access?

# Automobile: Indirect Physical Access

- ❑ OBD-II
  - ❑ Diagnostics port used by mechanics to check vehicle systems
  - ❑ Most auto shops use a wired or wireless “pass-thru” device to connect PC to OBD-II port
- ❑ Entertainment system
  - ❑ Fully integrated into CAN for the purpose of providing user feedback (e.g., chime, camera, proximity sensors)
- ❑ Checkoway et al.
  - ❑ Created an audio file which, when played through the entertainment system, exploits a vulnerability in the playback code to send arbitrary CAN packets to the bus
  - ❑ Demonstrated vulnerabilities in pass-thru device which could be used to attack every vehicle inspected with the device

# Automobile: Short-range Wireless

- ❑ Bluetooth
- ❑ Remote Keyless Entry
- ❑ Tire Pressure Monitoring System (TPMS)
  
- ❑ Checkoway et al.
  - ❑ Exploited vulnerabilities in glue code between vehicle and popular embedded implementation of Bluetooth stack
  - ❑ Bluetooth device must be paired
    - ❑ Trojan on driver's device
    - ❑ Determined attacker with extended proximity

# Automobile: Long-range Wireless

- ❑ Broadcast
  - ❑ FM RDS
  - ❑ Satellite radio
  - ❑ GPS
- ❑ Cellular
  
- ❑ Checkoway et al.
  - ❑ Reverse engineered common telematics data protocol
  - ❑ Call the car, bypass authentication, inject malicious code for command and control

# Automobiles: The Future

- ❑ Dedicated Short-range Communications (DSRC)
  - ❑ Vehicle to Vehicle (V2V) for collision avoidance

*US Department of Transportation*

# Other Safety-Critical Systems

- ❑ Infrastructure
  - ❑ Power grid
  - ❑ Water supply
- ❑ Transportation
  - ❑ Aviation
- ❑ Military devices

# Other Safety-Critical Systems: Infrastructure

- ❑ Supervisory Control and Data Acquisition (SCADA)
- ❑ SCADA systems can be used in a wide variety of industrial contexts
  - ❑ Water purification
  - ❑ Power generation (including nuclear)
- ❑ Stuxnet
  - ❑ Known to target certain SCADA systems
  - ❑ Propagated via sneaker-net (i.e., USB key)

# Other Safety-Critical Systems: Transportation

## Aviation

- ❑ Like cars, airplanes use embedded systems
  - ❑ Avionics – electronic systems in the cockpit
  - ❑ Boeing 787 Dreamliner
    - ❑ wireless control systems
- ❑ Air Traffic Control
- ❑ Regulated by FAA

# Vulnerabilities within Safety-Critical Systems

- ❑ Systems comprised of multiple components provided by multiple entities
- ❑ Components often suffer from common vulnerabilities (e.g., no buffer overflow protection, no guard against user-provided content)
- ❑ Manufacturer's do not have resources to conduct full security analysis of every component
- ❑ However, components are often treated as fully-trusted components of the system

# Economics of Security in Safety-Critical Systems

- ❑ Gaynor et al. compared competition between hospitals to patient data protection practices
  - ❑ Found that greater competition within a given hospital market breeds looser data protection practices
  - ❑ Instead of security, budget is spent in ways that make the hospital more appealing to would-be patients
    - ❑ Consider Highmark and UPMC here in Pittsburgh
- ❑ Conclusion: in highly competitive markets, security will be sacrificed in favor of consumer visible features that affect the purchase decision
  - ❑ FDA: implementing cybersecurity requirements
  - ❑ NHTSA: Vehicle Electronics and Emerging Technologies Division
